

## 5.1. Line graphs

You can draw a line graph to show changes, for example, this one shows changes in temperature over time.

Fatima was ill during March. This graph is her temperature chart.

Intermediate points on a line graph may or may not have meaning. In this case, points are joined to show trends.

- A normal body temperature is  $37^{\circ}\text{C}$ . What date did Fatima become ill?
- What was her highest temperature?
- How many days did it take for her temperature to return to normal? Start counting from when her temperature reached the highest point.
