

What is a prosthetic eye ? A prosthetic eye ,also known as an artificial eye , is a special kind of eye made by doctors to help people who don't have a real eye.

How is it **similar to** a real eye ? Both artificial and real eyes can look similar from the outside , so they appear natural.

How is different from a real eye ?
prosthetic eyes don't see like real
eyes . they're not able to see or send
signals to the brain . Real eyes can see
and send information to the brain to
understand what we see.

Prosthetic eyes usually can't move on their own like real eyes .
Real eyes can move different directions to look at things.

An artificial eye doesn't work like a real eye . It's replacement for a missing or damaged eye.it looks like a real eye but can 't see . It stays in place ,helping the person look more natural . Scientist are Still researching and testing new models, too.
