

* 1.1. Body organs

You know what the outside of your body looks like. But what's inside your body?

Think of as many inside parts as you can.

The parts inside your body are called organs. The body organs do different jobs to keep you alive and healthy. Different organs work together to form organ systems.

The major body organs are the heart, stomach, intestines, lungs, kidneys and brain.

Look at the diagram. The organs have the wrong labels. Write the correct name for each organ in the space next to the label.
